

Restaurant Management System

Scenario: A restaurant management system is a software designed to manage a restaurant's primary operations. Restaurants use restaurant management systems to keep track of customer orders and store orders for different calculations such as total sales. These systems help restaurants with inventory management by keeping track of products and resources available. Additionally, menu items are organized through these systems depending on the stored inventory information. Employee data including clock in and out information is stored in such systems and should be available for editing. Managers can perform the same tasks as other employees, including editing items and employee information and generating reports.

Accepted Format:

As a [type of user], I want to [perform some task] (optional) so that [achieve some goal].
